

ABSTRACT OF THE DISCLOSURE

The present invention provides a system and method for securing login to a system. In architecture, the system includes an identifier that identifies a user to login, and a validator that validates the user access privileges. An entry mechanism allows the user to enter the system if the user access privileges are valid. The present invention can also be viewed as a method for securing login to a system. The method operates by identifying a user to login, and validating the user access privileges. The user is allowed to enter the system if the user access privileges are valid
